The Story: Water Tank

Water tanks have long provided people with water for drinking, irrigation, fire safety, and more. Once peppering the American landscape, water tanks were spread out about every ten miles alongside rail lines to give steam-powered trains the water they needed.

Throughout history, water tanks were wooden, stone, or ceramic as these materials were known to stand the test of time. However, wooden water tanks are now becoming more of a relic as these wooden tanks are being dismantled and replaced with newer materials like carbon steel, fiberglass, and concrete.

From its coastal Northern California roots, this Redwood is naturally durable, weather resistant, and still in great condition. Our Water Tank Redwood has a naturally distressed, deep-brown patina, and a smooth reddish interior with a few dark nail holes and cracks. This wood's beautiful character and long lasting qualities make it an ideal medium to create new life in any space.
